SHELVING SYSTEM

DESIGN LARS VEJEN, schmidt hammer lassen design

With this new interior design concept schmidt hammer lassen design has created a new series combining our 60/30 Classic Steel shelving with some exciting new add-ons!

This concept gives us a host of new design options, with the possibility of creating different zones for different purposes and different types of users.

It gives flexibility as the design and configuration can be changed according to shifting demands and needs.

Separately the shelving and the add-ons maintain their own functionality, but put together they give new flexibility, although the original accessibility and efficiency with regards to storage is retained.

An acrylic sheet (3 mm) is attached between two steel end panels in slots with an angle of 13 degrees. This creates the interesting effect of a tilted arc.

The acrylic sheet comes in many standard colours and can also be delivered covered with foil which gives unlimited "finish" possibilities.

The acrylic sheet can be replaced by a polycarbonate sheet (3 mm) which is stronger than the acrylic sheet and has a flame-retardant effect. This option is available in three colours: white, opaque and bronze.
